

HCL AppScan Report

Report Type: Security Report

Scan Name: SCA 2025-07-15 demo.irx

Technology: SCA

Report created at: Wednesday, July 16, 2025

This report was generated by HCL AppScan

Summary of security issues

Critical severity issues: 5

High severity issues: 19

Medium severity issues: 10

Low severity issues: 1

Total security issues: 35

Scan Information

Scan started: Thursday, February 13, 2025 11:53:11 AM (UTC)

Method: Source code and config scanning

CVSS	7.5
Date Created	Tuesday, July 15, 2025
Last Updated	Tuesday, July 15, 2025
CWE:	829

Issue 1 of 5 - Details

Name:	CVE-2021-36090
Description:	When reading a specially crafted ZIP archive, Compress can be made to allocate large amounts of memory that finally leads to an out of memory error even for very small inputs. This could be used to mount a denial of service attack against services that use Compress' zip package.
Resolution:	Upgrade package to version greater than or equal to 1.21
URL:	https://www.cve.org/CVERecord?id=CVE-2021-36090
Dependency Root:	

Issue 2 of 5

Issue ID:	31e5c806-7761-f011-8f7c-0022484e6819
Severity:	High
Status	Open
Fix Group ID:	20e5c806-7761-f011-8f7c-0022484e6819

CWE:	829

Issue 2 of 5 - Details

Name: CVE-2021-35516

Description: When reading a specially crafted 7Z archive, Compress can be made to allocate large amounts of memory that finally leads to an out of memory error even for very small inputs. This could be used to mount a denial of service attack against services that use Compress' sevenz package.

Resolution: Upgrade package to version greater than or equal to 1.21

URL: <https://www.cve.org/CVERecord?id=CVE-2021-35516>

Dependency Root:

CWE:	829

Issue 4 of 5 - Details

Name: CVE-2021-35515

Description: When reading a specially crafted 7Z archive, the construction of the list of codecs that decompress an entry can result in an infinite loop. This could be used to mount a denial of service attack against services that use Compress' sevenz package.

Resolution: Upgrade package to version greater than or equal to 1.21

URL: <https://www.cve.org/CVERecord?id=CVE-2021-35515>

Dependency Root:

Last Updated	Tuesday, July 15, 2025
CWE:	829

Issue 1 of 1 - Details

Name:	CVE-2012-5783
Description:	Apache Commons HttpClient 3.x, as used in Amazon Flexible Payments Service (FPS) merchant Java SDK and other products, does not verify that the server hostname matches a domain name in the subject's Common Name (CN) or subjectAltName field of the X.509 certificate, which allows man-in-the-middle attackers to spoof SSL servers via an arbitrary valid certificate.

Resolution: Upgrade package to version greater than or equal to 4.0
URL: https://www.cve.org/CVERecord?id=CVE-2012-5783
Dependency Root:

H Common Open Source: Open Source Component: commons-io:commons-io

CWE:	829

Issue 2 of 2 - Details

Name:	CVE-2021-29425
-------	----------------

Description: In Apache Commons IO before 2.7, When invoking the method `FileNameUtils.normalize` with an improper input string, like `".././foo"`, or `"\\..\\foo"`, the result would be the same value, thus possibly providing access to files in the parent directory, but not further above (thus "limited" path traversal), if the calling code would use the result to construct a path value.

Resolution: Upgrade package to version greater than or equal to 2.7

URL: <https://www.cve.org/CVERecord?id=CVE-2021-29425>

Dependency Root:

CWE:	829

Issue 1 of 6 - Details

Name:	CVE-2019-17571
Description:	Included in Log4j 1.2 is a SocketServer class that is vulnerable to deserialization of untrusted data which can be exploited to remotely execute arbitrary code when combined with a deserialization gadget when listening to untrusted network traffic for log data. This affects Log4j versions up to 1.2 up to 1.2.17.
Resolution:	Upgrade package to version greater than 1.2.27
URL:	https://www.cve.org/CVERecord?id=CVE-2019-17571
Dependency Root:

CWE:	829

Issue 2 of 6 - Details

Name:	CVE-2022-23305
Description:	By design, the JDBCAppender in Log4j 1.2.x accepts an SQL statement as a configuration parameter where the values to be inserted are converted from PatternLayout. The message converter, %m, is likely to always be included. This allows attackers to manipulate the SQL by entering crafted strings into input fields or headers of an application that are logged allowing unintended SQL queries to be executed. Note this issue only affects Log4j 1.x when specifically configured to use the JDBCAppender, which is not the default. Beginning in version 2.0-beta8, the JDBCAppender was re-introduced with proper support for parameterized SQL queries and further customization over the columns written to in logs. Apache Log4j 1.2 reached end of life in August 2015. Users should upgrade to Log4j 2 as it addresses numerous other issues from the previous versions.
Resolution:	Upgrade package to version greater than 1.2.17
URL:	https://www.cve.org/CVERecord?id=CVE-2022-23305
Dependency Root:

Issue 3 of 6 - Details

Name:	CVE-2022-23302
Description:	JMS Sink in all versions of Log4j 1.x is vulnerable to deserialization of untrusted data when the attacker has write access to the Log4j configuration or if the configuration references an LDAP service the attacker has access to. The attacker can provide a TopicConnectionFactoryBindingName configuration causing JMS Sink to perform JNDI requests that result in remote code execution in a similar fashion to CVE-2021-4104. Note this issue only affects Log4j 1.x when specifically configured to use JMS Sink, which is not the default. Apache Log4j 1.2 reached end of life in August 2015. Users should upgrade to Log4j 2 as it addresses numerous other issues from the previous versions.
Resolution:	Upgrade package to version greater than 1.2.17

Issue 4 of 6 - Details

Name:	CVE-2023-26464
Description:	** UNSUPPORTED WHEN ASSIGNED ** When using the Chainsaw or SocketAppender components with Log4j 1.x on JRE less than 1.7, an attacker that manages to cause a logging entry involving a specially-crafted (ie, deeply nested) hashmap or hashtable (depending on which logging component is in use) to be processed could exhaust the available memory in the virtual machine and achieve Denial of Service when the object is deserialized. This issue affects Apache Log4j before 2. Affected users are recommended to update to Log4j 2.x. NOTE: This vulnerability only affects products that are no longer supported by the maintainer.
Resolution:	Upgrade package to version greater than or equal to 2.0
URL:	https://www.cve.org/CVERecord?id=CVE-2023-26464
Dependency Root:

How to Fix

C Open Source Component

Cause

A vulnerable version of third party software component is installed in the tested application.

Risk

A vulnerable third party software component may introduce all manner of vulnerabilities into the application

Fix recommendation

Upgrade to the latest version of the third party software component. We highly recommend contacting the vendor of this product to see if a patch or fix has recently been made available.
